Introduction to Real-Time and Embedded Systems

Defining Real-Time Systems

Real-time systems are computing systems that must process data and produce responses within strict timing constraints. Unlike general-purpose systems, where correctness is primarily determined by logical results, real-time systems emphasize timeliness and predictability. They are classified into two categories:

- **Hard Real-Time Systems:** Missing a deadline could lead to catastrophic failures, such as in medical or aerospace applications.
- **Soft Real-Time Systems:** Deadlines are important but not critical; performance degradation is acceptable if deadlines are occasionally missed.

Understanding Embedded Systems

Embedded systems are dedicated computing units designed to perform specific functions within larger systems. They are characterized by:

- Limited resources (memory, processing power)
