What Are Ecosystems?

Ecosystems are dynamic communities where living organisms interact with each other and their physical environment. These systems are vital for maintaining life on Earth and are characterized by the flow of energy and cycling of nutrients.

Defining Ecosystems

An ecosystem includes all organisms (plants, animals, fungi, microorganisms) in a particular area, along with the non-living components like water, soil, air, and sunlight. These elements work together to form a self-sustaining system.

Components of Ecosystems

Ecosystems comprise two main components:

- **Biotic Factors:** The living parts of an ecosystem, such as plants, animals, bacteria, and fungi.
- **Abiotic Factors:** The non-living physical components, including sunlight, temperature, water, minerals, and soil type.

Types of Ecosystems

Ecosystems are diverse, ranging from small pond environments to vast forests and oceans. Common types include:

- Terrestrial ecosystems (forests, grasslands, deserts)
- Aquatic ecosystems (freshwater, marine)
